Employment History

Since 2017 I have been working on building systems for internal and external use for customers from different market segments and using different technologies. During this time I participated in the idealization, planning and development of solutions for human resources, accounting, inventory and more. Most of these applications were built with the PHP/Laravel stack, MySQL, Bootstrap and jQuery. Despite this, other technologies used were .NET Core, Flutter, Vue.js, Tailwind CSS, Redis and PostgreSQL. From 2018 I also started to accept jobs as a freelancer developing commercial solutions in already known stacks.
